

DATORKER[®] Strain Wave Gear

Technical Information

HIWIN® INDUSTRIE 4.0 Best Partner

Single-Axis Robot

Precision / Semiconductor / Medical / FPD

- KK, SK
- KS, KA
- KU, KE, KC

Multi-Axis Robot

Pick-and-Place / Assembly / Array and Packaging / Semiconductor / Electro-Optical Industry / Automotive Industry / Food Industry

- Articulated Robot
- Delta Robot
- SCARA Robot
- Wafer Robot
- Electric Gripper
- Integrated Electric Gripper
- Rotary Joint

Ballscrew

Precision Ground / Rolled

- Super S Series
- Super T Series
- Mini Roller
- Ecological & Economical Lubrication Module E2
- Rotating Nut (R1)
- Energy-Saving & Thermal-Controlling (Cool Type)
- Heavy Load Series (RD)
- Ball Spline

Linear Guideway

Automation / Semiconductor / Medical

- Ball Type--HG, EG, WE, MG, CG
- Quiet Type--QE, QW, QR
- Other--RG, E2, PG, SE, RC

Bearing

Machine Tools / Robot

- Crossed Roller Bearing
- Ballscrew Bearing
- Linear Bearing
- Support Unit

DATORKER® Strain Wave Gear

Robot / Automation Equipment / Semiconductor Equipment / Machine Tools

- DSC Type
- DSH Type

AC Servo Motor & Drive

Semiconductor / Packaging Machine / SMT / Food Industry / LCD

- Drives--D1, D2T/D2T-LM, E1
- Motors--50W~2000W

Medical Equipment

Hospital / Rehabilitation Centers / Nursing Homes

- Robotic Gait Training System
- Robotic Endoscope Holder

Linear Motor Stage

Automated Transport / AOI Application / Precision / Semiconductor

- Iron-core Linear Motor
- Coreless Linear Motor
- Linear Turbo Motor LMT
- Planar Servo Motor
- Air Bearing Platform
- X-Y Stage
- Gantry Systems
- Single-Axis Linear Motor Stage

Torque Motor & Direct Drive Motor

Machine Tools

- Torque Motor-- TM-2/IM-2, TMRW Series

Inspection / Testing Equipment / Robot

- Direct Drive Motor-- DMS, DMY, DMN, DMT Series

Preface

DATORKER® – Strain Wave Gear has the characteristics of high precision, high efficiency, high torsional rigidity and low starting torque. It is widely used in robots, automation equipment, semiconductor equipment, machine tools and other industries.

HIWIN has developed various specifications and reduction ratios to provide customers with wide range of choice. HIWIN is able to provide customized services to meet customers' various design and requirement.

1. Basic information

1-1 Features

- Compact and light weight – Easy for user to assemble and work with.
- High accuracy – Provides stable repeatability and positioning.
- Customization – Can be customized according to requirements.
- High torque – Widely used in automation and inspection equipment.
- Wide reduction ratio – Various choices available under same model.

1-2 Structure

Flex Spline

Slim and resilient metal with external teeth on the outer circle. Continuous elastic deformation when working; usually used as an output.

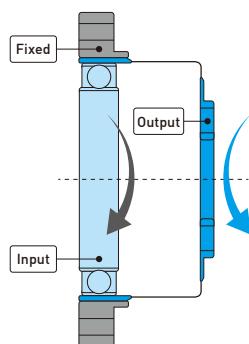

Circular Spline

The rigid circular part has teeth on the inner bore side, and there are 2 teeth more than the external teeth of flex spline; it is usually used as the fixed end.

Wave Generator

With an elliptical geometric feature, it makes the flex spline engaging with the circular spline. Usually used as an input.

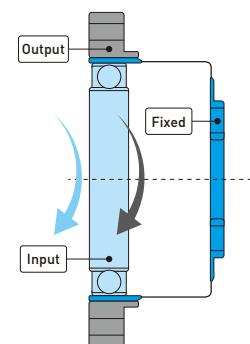

Reduction ratio and rotation direction

Input and Output with reverse direction rotation

$$\text{Reduction ratio} = \frac{-1}{R}$$

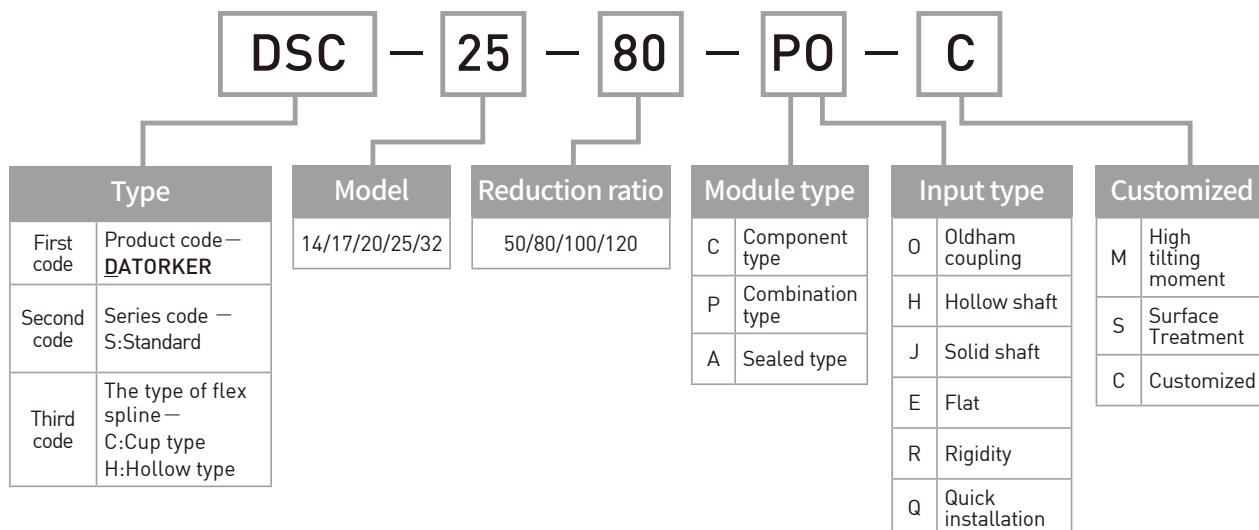

(R = No. of external teeth ÷ difference between no. of external and internal teeth)

Input and Output with the same direction rotation

$$\text{Reduction ratio} = \frac{1}{R+1}$$

1-3 Specification

1-4 Type / Function

DSC Type

Oldham Component Type (CO)

- Input shaft self-aligning.
- Self-assembly of parts required.

Oldham Combination Type (PO)

- Input shaft self-aligning.
- Withstand axial and radial load.

DSH Type

Oldham Combination Type (PO)

- Input shaft self-aligning.
- Withstand axial and radial load.

Hollow Combination Type (PH)

- Input hollow shaft design.
- Withstand axial and radial load.

Hollow Sealed Type (AH)

- Input hollow shaft design.
- Withstand axial and radial load.
- Completely sealed design.
- User friendly design.

Solid Shaft Type (AJ)

- Input solid shaft design.
- Withstand axial and radial load.

DSC-M Type (Higher tilting moment compare with DSC type)

Oldham Combination Type (PO)

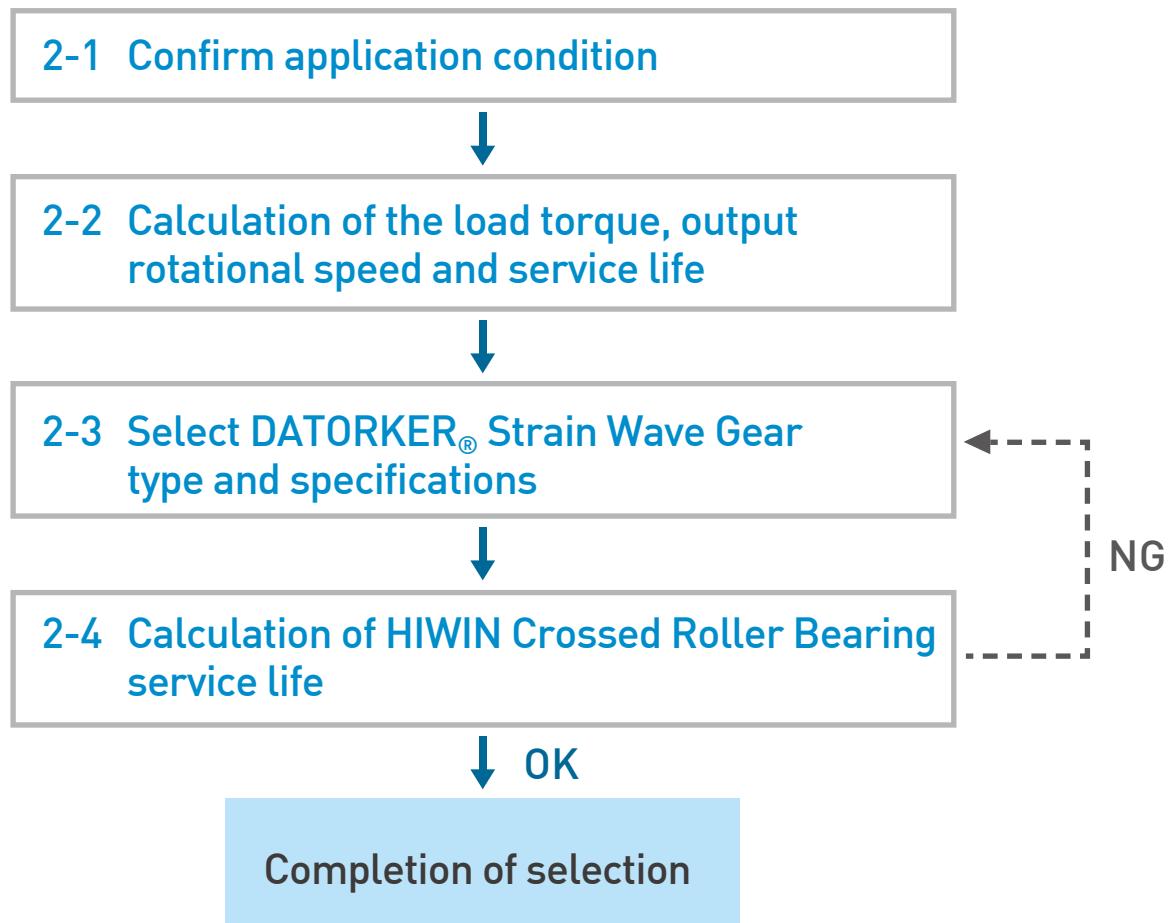

- Input shaft self-aligning.
- Withstand axial and radial load.

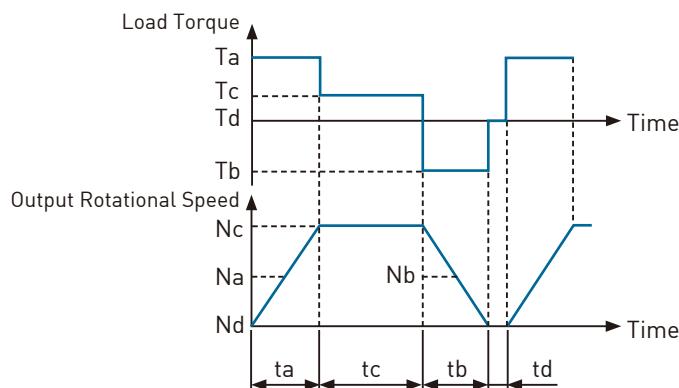

Solid Shaft Type (AJ)

- Input solid shaft design.
- Withstand axial and radial load.

2. Selection Procedure

2-1 Confirm application condition

Model	Item	Load Torque	Time	Output Rotational Speed	Maximum Output Rotational Speed	Maximum Input Rotational Speed
Start Time (Acceleration)	T_a	t_a	N_a	N_{max}	N_{max}	N_{max}
	T_c	t_c	N_c			
	T_b	t_b	N_b			
	T_d	t_d	N_d			
	T_e	t_e	N_e			

2-2 Calculation of load torque, rotational speed and service life

2-2-1 Calculate load torque

$T_{av} \leq$ Permissible maximum value of average load torque

2-2-2 Confirm

$T_a \vee T_b \leq$ Permissible peak torque at start/stop

2-2-3 Confirm

$T_e \leq$ Permissible maximum instantaneous torque

2-2-4 Calculate

$n_{av} \leq$ Permissible average input rotational speed

$n_{max} \leq$ Permissible maximum input rotational speed

2-2-5 Calculate

$L_h \geq$ Reducer rated service life 7000 hours (L_{10} :10% damage probability)
35000 hours (L_{50} :average life)

2-2-1 Permissible maximum value of average load torque

When the input rotational speed or load torque changes, please calculate the average load torque and confirm whether it meets the rated performance table values of each specification. Please pay attention that if the value exceeds the catalog value, it may cause premature lubricant deterioration and abnormal gear wear due to heat.

$$\text{Calculate average load torque } T_{av} = \sqrt[3]{\frac{N_1 t_1 |T_1|^3 + N_2 t_2 |T_2|^3 + \dots + N_n t_n |T_n|^3}{N_1 t_1 + N_2 t_2 + \dots + N_n t_n}}$$

2-2-2 Permissible peak torque at start/stop

During start and stop, due to the moment of inertia of the load, a load greater than the average torque will act on the reducer.

2-2-3 Permissible maximum instantaneous torque

The maximum allowable load torque when an impact occurs.

2-2-4 Permissible average input rotational speed & Permissible maximum input rotational speed

When setting the operating conditions of the reducer, do not exceed the values indicated in the rated performance table.

$$\text{Calculate average output rotational speed } N_{av} = \frac{N_1 t_1 + N_2 t_2 + \dots + N_n t_n}{t_1 + t_2 + \dots + t_n}$$

$$\text{Calculate average input rotational speed } n_{av} = N_{av} \times R$$

$$\text{Calculate maximum input rotational speed } n_{max} = N_{max} \times R$$

R is Reduction Ratio

2-2-5 Reducer rated service life

The operating service life of the reducer depends on the flex bearing of the wave generator. The nominal service life of the wave generator is 7000 hours. The calculation formula is as follows:

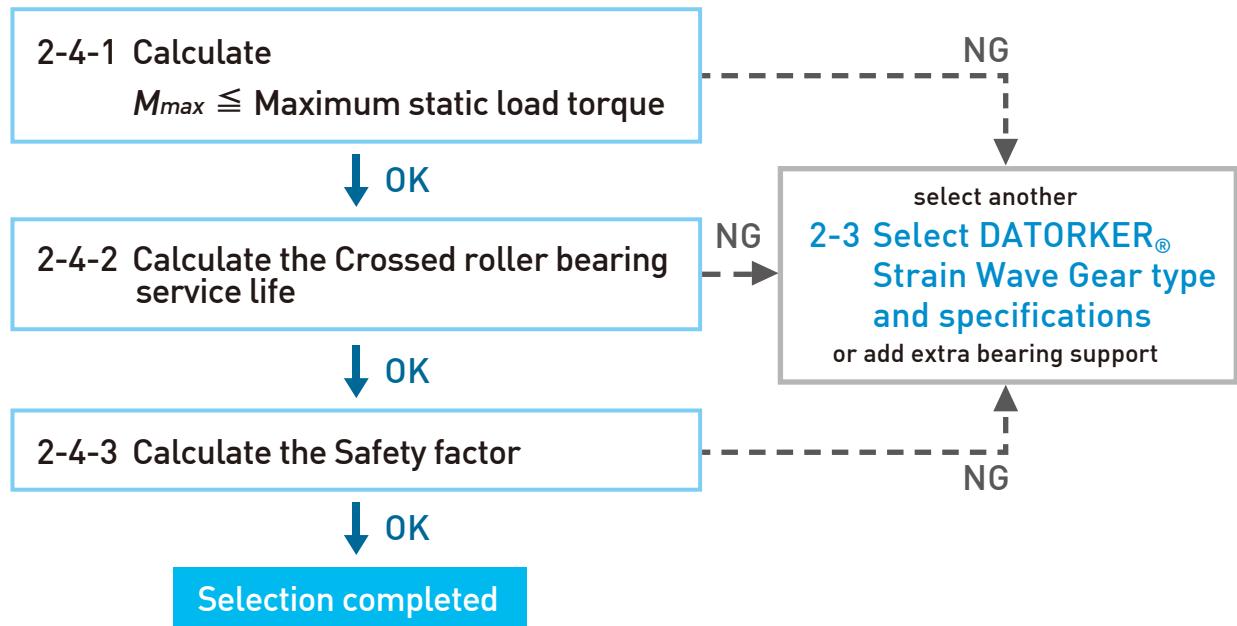

$$\text{Calculate service life } L_h = 7000 \times \left(\frac{T_r}{T_{av}} \right)^3 \times \left(\frac{n_r}{n_{av}} \right)$$

T_r is Rated torque, n_r is Rated rotational speed

2-3 DATORKER® type and specification selection

Select the DATORKER® model according to the operation requirements, and check the Rated performance table of each unit according to the calculation results from the previous step, to confirm if the selected model specifications will meet the application. If the reducer is installed with a crossed roller bearing, please proceed to the next step and calculate the service life of the crossed roller bearing.

2-4 Calculation of the Crossed Roller Bearing service life

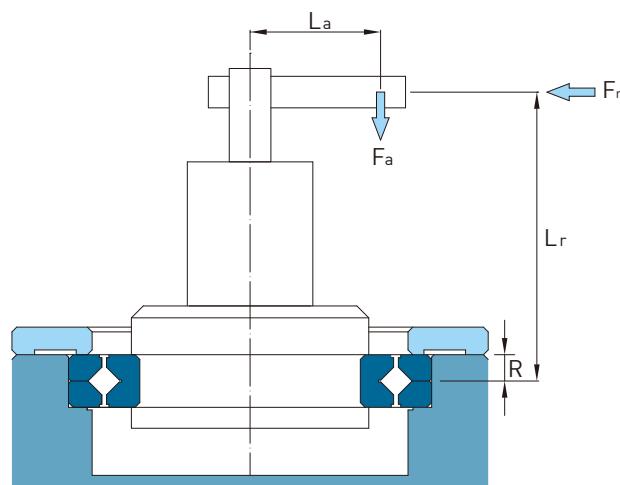

2-4-1 Maximum static load moment

The crossed roller bearing can withstand the maximum radial and maximum axial load.

Calculate maximum static load moment $M_{max} = F_{rmax} \times L_r + F_{amax} \times L_a$

F_r is radial load, F_a is axial load

2-4-2 Calculation for Service life of Crossed roller bearings

$$\text{Calculate basic service life } L = \left(\frac{C}{F_w \times P} \right)^{\frac{10}{3}}$$

P is dynamic equivalent load, C is basic dynamic load rating,
 F_w is load factor.

Load condition	Load factor (F_w)
No impact / vibration	1 ~ 1.2
Normal	1.2 ~ 1.5
With impact & vibration	1.5 ~ 3

$$\text{Calculate dynamic equivalent load } P = X \left(F_r + \frac{2M}{D_{pw}} \right) + Y F_a$$

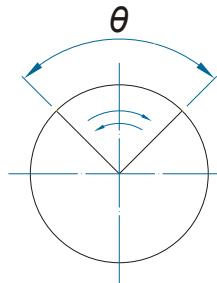

where $\frac{F_a}{F_r + 2M/D_{pw}} \leq 1.5$ for, $X=1 \wedge Y=0.45$ ° where $\frac{F_a}{F_r + 2M/D_{pw}} \geq 1.5$ for, $X=0.67 \wedge Y=0.67$ °.

M is Torque, D_{pw} is pitch circle diameter

In a reciprocating oscillation application, please calculate according to the following formula

$$\text{Calculate service life of oscillating } L_{oc} = \frac{180^\circ}{\theta} \times L$$

θ is the angle of the oscillating

2-4-3 Calculate the Safety factor

The safety factor is determined by the basic static load rating and the static equivalent load, as follows :

$$\text{Calculate Safety factor } f_s = \frac{C_o}{P_o}$$

P_o is static equivalent load, C_o is basic static load rating.

Calculate basic static equivalent load

$$P_o = F_r + \frac{2M}{D_{pw}} + 0.44F_a$$

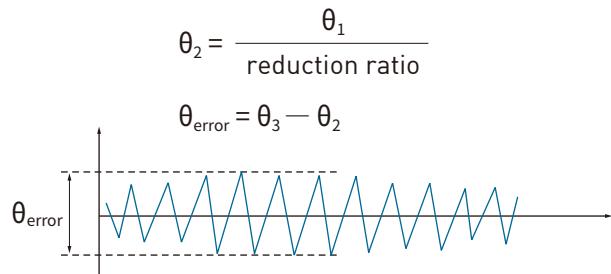

Operation condition	Safety factor (f_s)
Standard operation	≥ 1.5
Bearing with vibrating load	≥ 2
High rotational speed and high accuracy	≥ 3

* The above table shows the lower limit of the static safety factor.
If it is a dynamic situation, it is recommended to safety factor of 7 or more.

3. Definition

3-1 Angle Transmission Accuracy

When any rotation angle (θ_1) is input, the difference in the value (θ_{error}) between the theoretical output rotation angle (θ_2) and the actual output rotation angle (θ_3) is the angle transmission accuracy.

3-2 Starting Torque

The maximum torque value required under no-load conditions, when the input (high speed) applies torque and the output (low speed) starts to operate.

3-3 Reversed Starting Torque

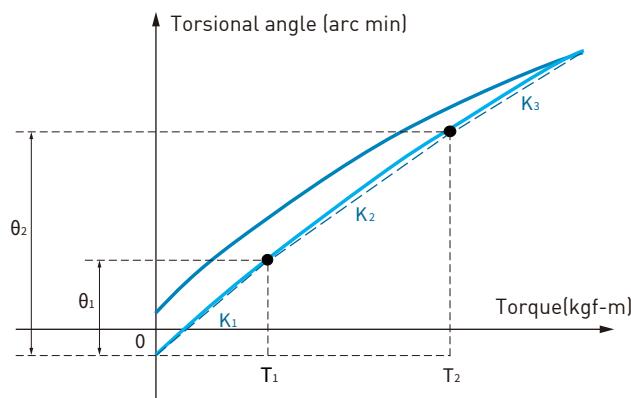

The maximum Torque value required under no-load conditions, when the output (low speed) applies torque and the input (high speed) starts to operate.

3-4 Torsional Rigidity

It is defined as the fixed input (wave generator) and applies a torque to the output (flex spline) of the Strain Wave Gear. The ratio generated by torque and the torsion angle.

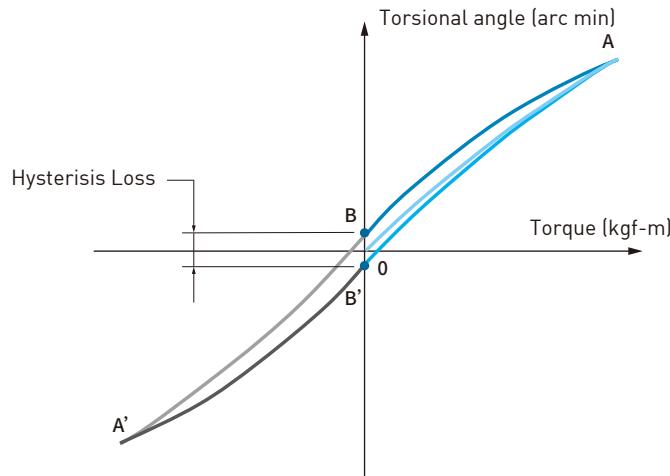

The slope of the "torque-torsion angle graph" is expressed as a spring constant. The "torque-torsion angle diagram" is divided into 3 parts, and the spring constant of each area is K_1 , K_2 and K_3 represent.

- K_1 refers to the spring constant from "0" to " T_1 "
- K_2 refers to the spring constant from " T_1 " to " T_2 "
- K_3 refers to the spring constant with a torque above " T_2 "

3-5 Hysteresis Loss

After the torque is applied to the rated value and return to "0", the torsion angle will not be completely "0", and will have some displacement (B-B'), which is called hysteresis loss. The hysteresis loss is mainly caused by internal friction. When the torque is extremely small, it is almost non-existent.

3-6 Maximum Backlash

In a mechanical system, the maximum displacement or amount of rotation or rotation of another part in a certain direction while maintaining one part stationary. The backlash of the HIWIN DATORKER® gear engage part is suppressed to "0". The source of the maximum backlash is caused by the gap between the Oldham coupling and the wave generator.

4-1-2 Efficiency E_R

DATORKER® efficiency would change by specification , ratio , operating conditions(speed/loading) and lubrication(lubricant type/quantity) .

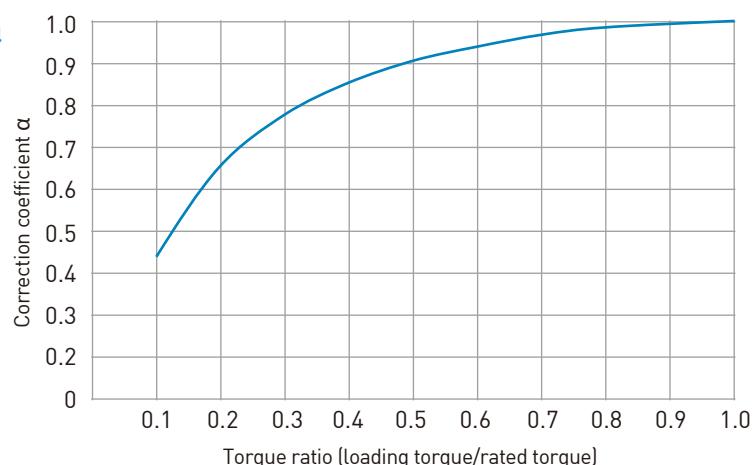

Efficiency correction coefficient α

$$\text{Efficiency} = \alpha \times E_R$$

α is correction coefficient

E_R is efficiency at the rated torque

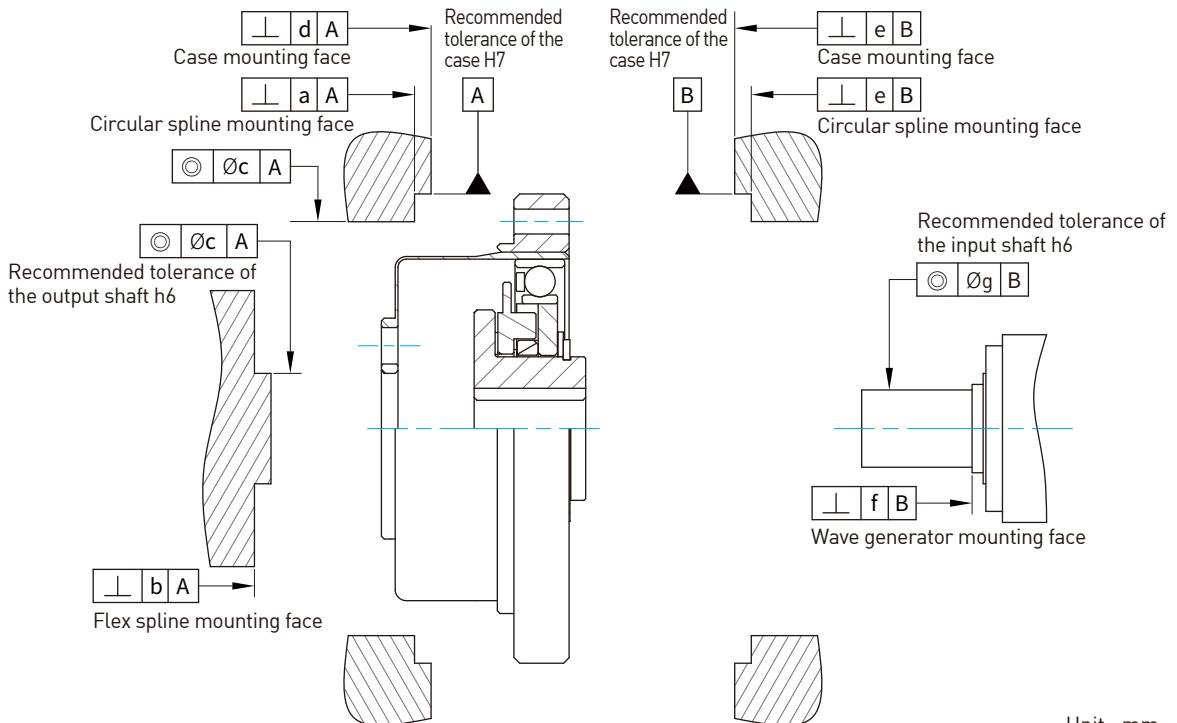

4-1-3 No-load operating torque

The torque necessary to drive the DATORKER® input (high-speed end) after running in at an input speed of 2000r/min under an average ambient temperature of 25° C without load for more than 2 hours.

Reduction Ratio	Input rotational speed	Model					Unit: cNm
		14	17	20	25	32

Note : The values in this table will vary depending on the working conditions and are for reference only. The upper limit is 20% above the value in this table.

4-1-4 Installation Accuracy

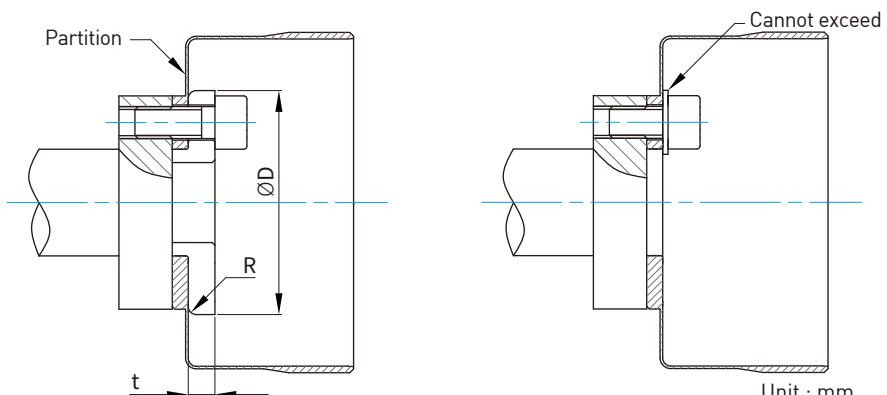

Unit : mm

Model Mark	14	17	20	25	32
a	0.011	0.012	0.013	0.014	0.016
b	0.008	0.011	0.014	0.018	0.022
Øc	0.015	0.018	0.019	0.022	0.022
d	0.011	0.015	0.017	0.024	0.026
e	0.011	0.015	0.017	0.024	0.026
f	0.017 (0.008)	0.020 (0.010)	0.020 (0.010)	0.024 (0.012)	0.024 (0.012)
Øg	0.030 (0.016)	0.034 (0.018)	0.044 (0.019)	0.047 (0.022)	0.050 (0.022)

Note: The value in () is the value of the wave generator (without oldham coupling).

4-1-5 Recommend size of the Press plate

Unit : mm

Model Mark	14	17	20	25	32
ØD _{-0.1}	24.5	29	34	42	55
R ₀ ^{+0.1}	1.2	1.2	1.4	1.5	2
t	2	2.5	2.5	5	7

Note : In order to avoid the sinking or loosening of the bolts on the press plate, it is recommended that: 1. The material is S45C; 2. The heat treatment hardness should be HB200~270.

4-1-6 Installation bolt tightening torque

1. Flex spline flange side

- When the load torque is less than the rated performance value in "Peak torque at start/stop" Table 4-1-1, use only bolts for installation.
- If the load torque may reach the rated performance value in "Instantaneous permissible max torque" Table 4-1-1, please use a combination of bolts and pins for installation.

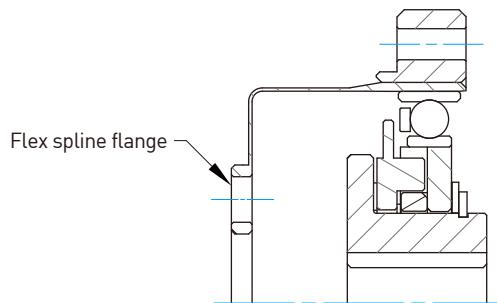

Table 4-1-8 Flex spline flange side bolt tightening torque

Item	Model	14	17	20	25	32
Number of bolts		6	6	8	8	8
Bolts size		M4	M5	M5	M6	M8

	kgfm	0.20	0.20	0.20	0.46	0.92

Note : 1. Recommended tightening torques for the 12.9 DIN EN ISO 4762 fastening bolts DIN912 in accordance with VDI 2230 for $\mu K = \mu G = 0.125$
2. Bolt-in depth at least 2 x thread diameter

4-1-7 Installation of Wave generator

Model Mark	14	17	20	25	32
G	0.4	0.3	0.1	2.1	2.5
H _{-0.1}	17.6	19.5	20.1	20.2	22
t	2.5	2.5	2.9	2.8	3.8

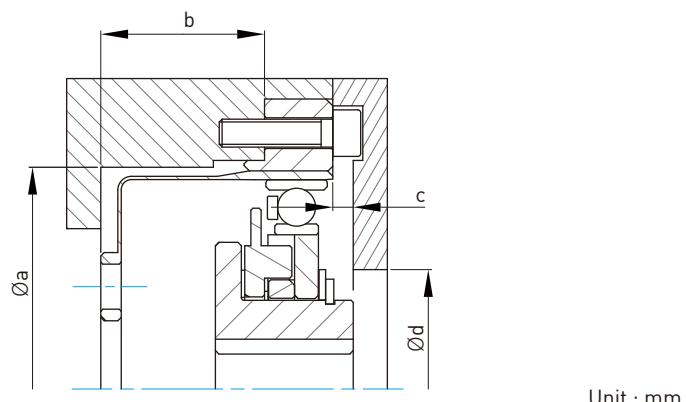

Note: 1. Avoid interference between the Wave generator and the locking bolt of the flex spline.

2. Due to the elastic deformation of the flex spline, the Strain Wave Gear applies thrust to the Wave generator during operation. The thrust will change with the operating conditions. In any case, a mechanism that prevents slipping due to the thrust of the Wave generator must be used.

4-1-8 Lubrication

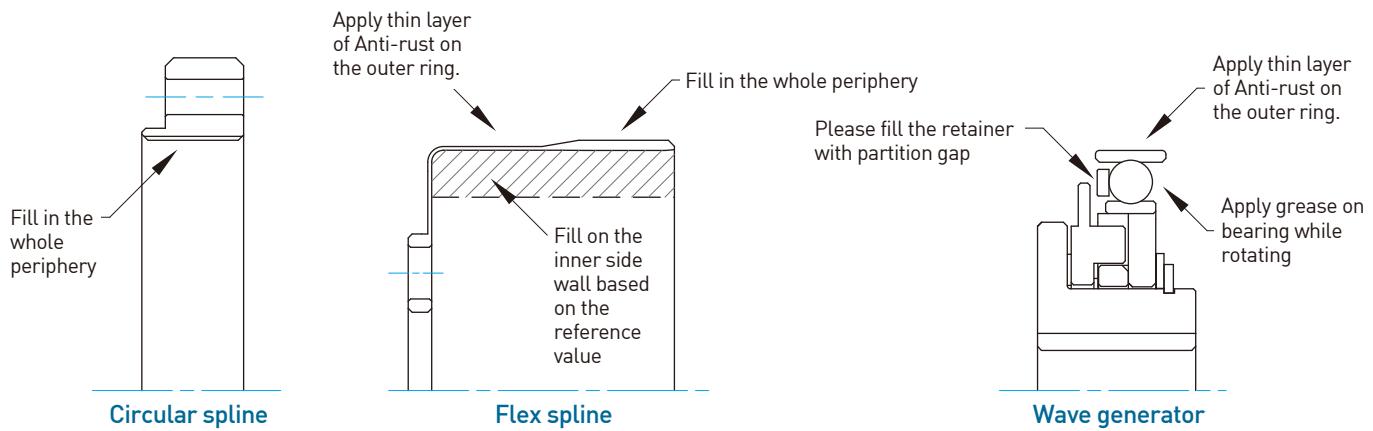

1. Recommended dimensions for the inner wall of the case

In order to avoid the splashing of excessive lubricant on other parts during operation. It is recommended to adhere to the following dimensions:

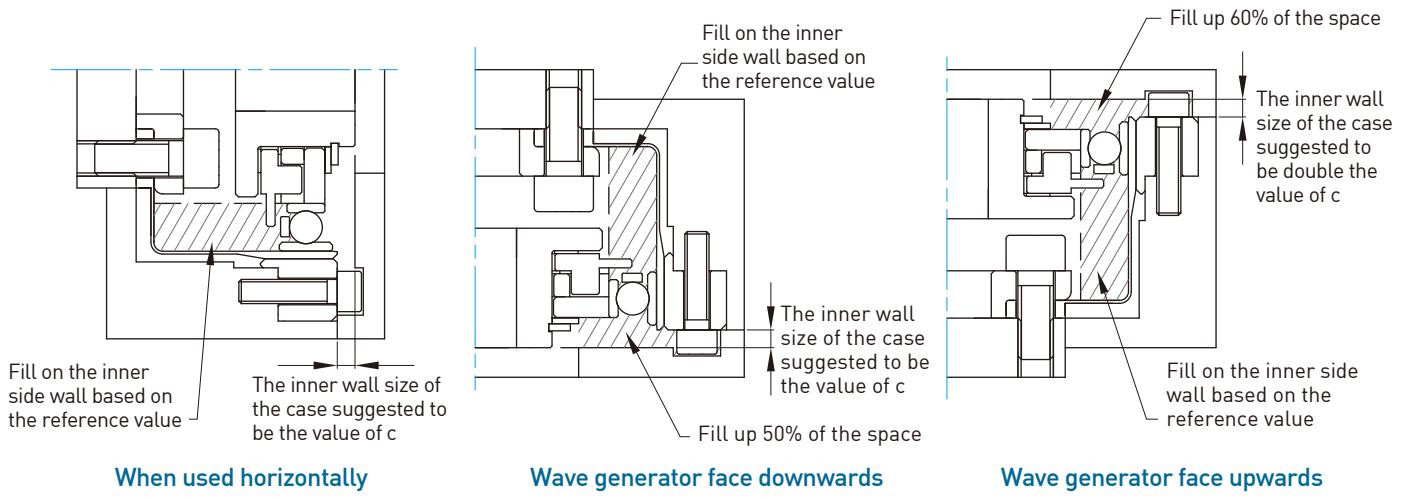

Model Mark	14	17	20	25	32
Øa	38	45	53	66	86
b	17.1	19	20.5	23	26.8
c	1	1	1.5	1.5	1.5
Ød	16	26	30	37	37

2. Lubricant application

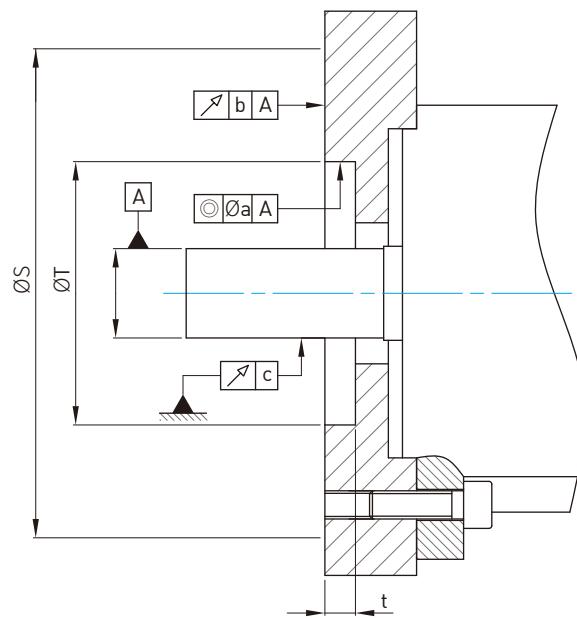

3. The key points of different application methods

Unit : g

Instructions		Model	14	17	20	25	32
Used horizontally		5.5	10	16	30	60	
Used vertical	Wave generator is facing down	7	12	18	35	70	
	Wave generator is facing up	8.5	14	21	40	80	

4-1-9 Motor installation

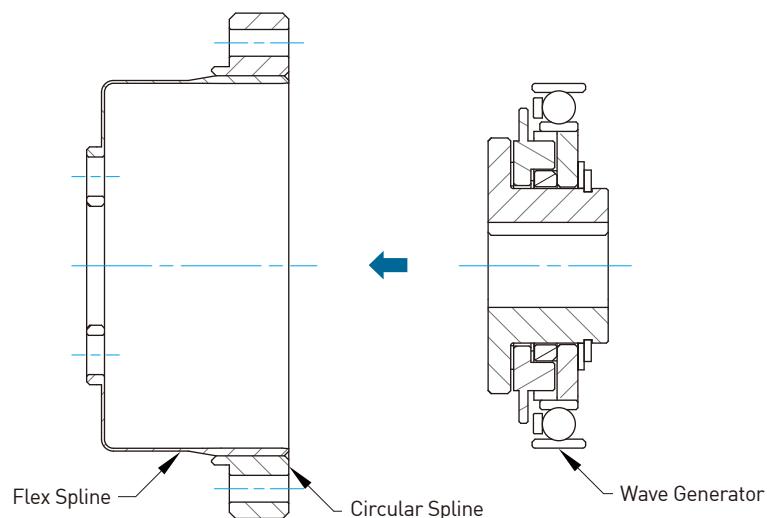

Unit : mm

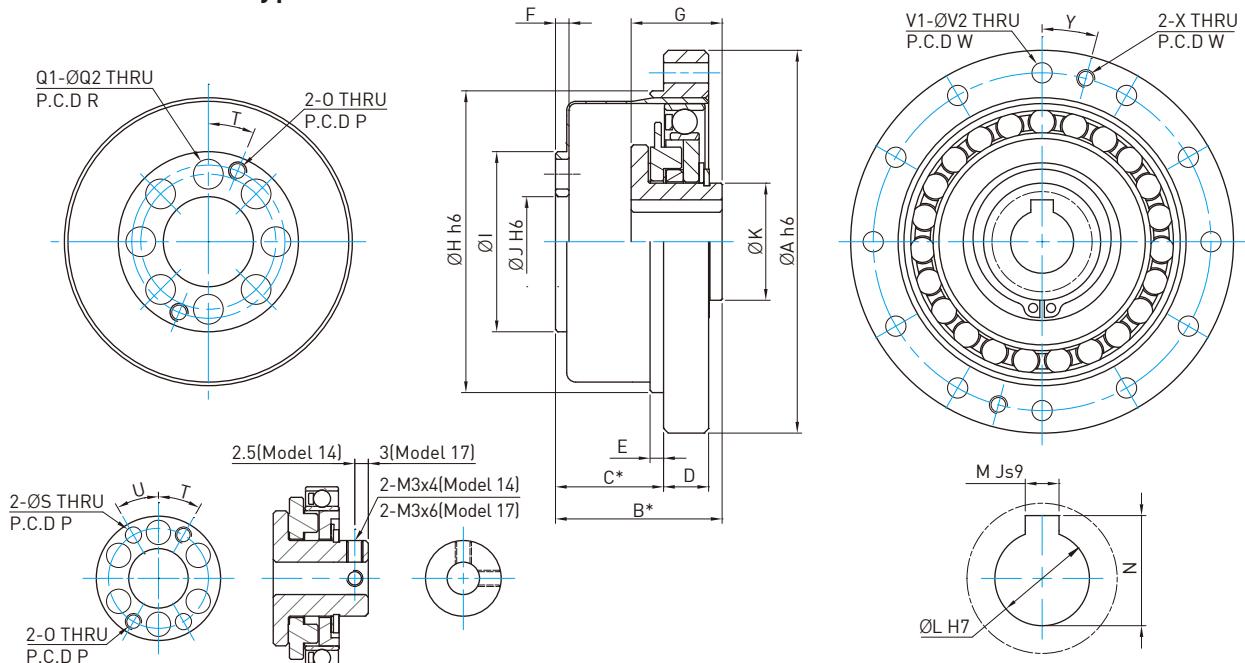

Mark	Model	14	17	20	25	32
a		0.03	0.04	0.04	0.04	0.04
b		0.03	0.04	0.04	0.04	0.04
c		0.015	0.015	0.018	0.018	0.018
ØS		73	79	93	107	138
t		3	3	4.5	4.5	4.5
ØT H7		38	48	56	67	90

4-1-10 Installation sequence

Install the circular spline and flex spline into the mechanism then install the Wave generator.

4-2-2 Efficiency E_R

DATORKER® efficiency would change by specification , ratio , operating conditions (speed/loading) and lubrication (lubricant type/quantity) .

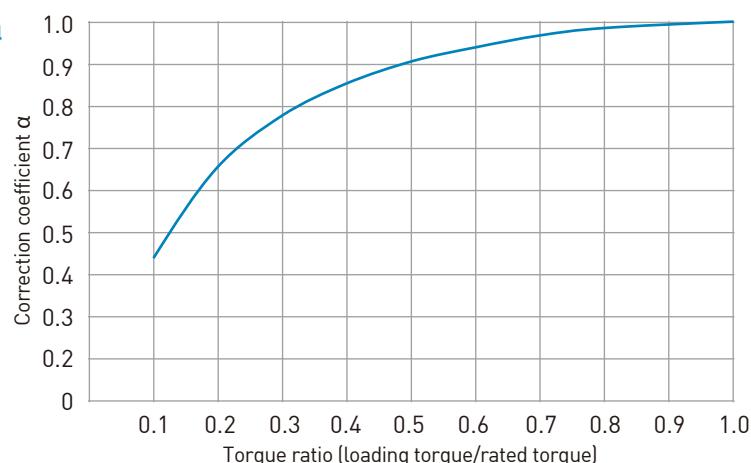

Efficiency correction coefficient α

$$\text{Efficiency} = \alpha \times E_R$$

α is correction coefficient

E_R is efficiency at the rated torque

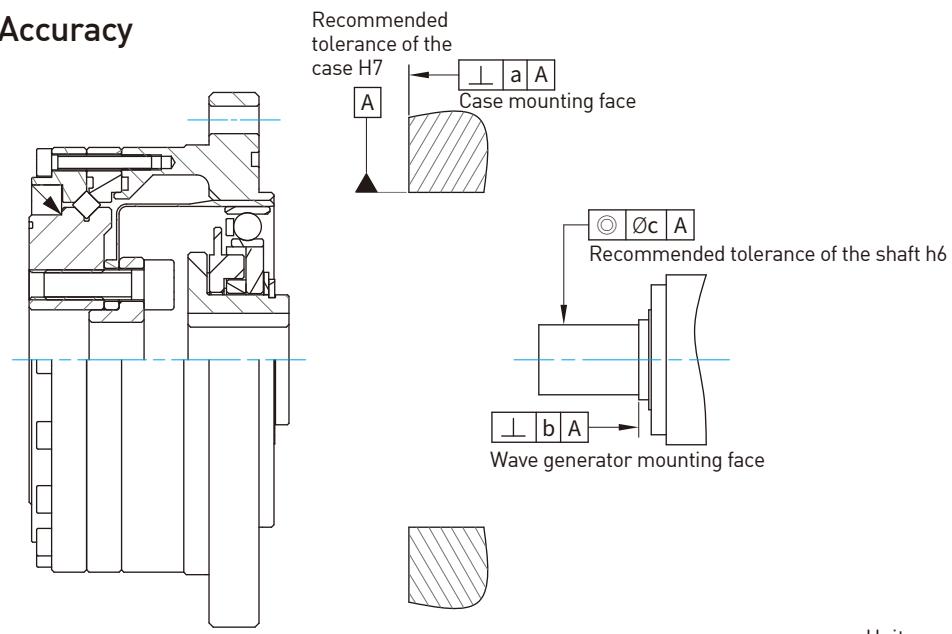

4-2-3 No-load operating torque

The torque necessary to drive the DATORKER® input (high-speed end) after running in at an input speed of 2000r/min under an average ambient temperature of 25° C without load for more than 2 hours.

Reduction Ratio	Input rotational speed	Model				
		14	17	20	25	32
50	500 r/min	3.2	5.1	7.3	12.8	26.1
	1000 r/min	3.9	6.1	9.1	17.8	33.1
	2000 r/min	4.6	7.6	11.8	21.8	44.1
	3500 r/min	5.9	9.6	12.7	28.8	57.1
80	500 r/min	2.3	3.8	5.5	9.7	20.3

4-5-2 Efficiency

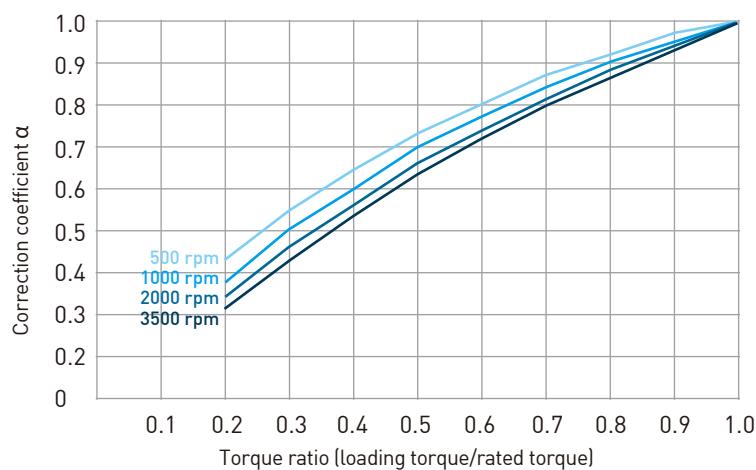

1. Rated torque E_R

DATORKER® efficiency would change by specification , ratio , operating conditions(speed/loading) and lubrication(lubricant type/quantity) .

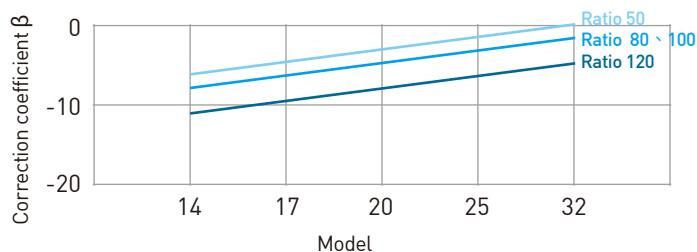

2. Correction coefficient α

Efficiency correction coefficient α
by loading torque

3. Correction coefficient β

Efficiency correction coefficient β
by specification

$$\text{Efficiency} = \alpha \times (E_R + \beta)$$

4-5-3 No-load operating torque

The torque necessary to drive the DATORKER® input (high-speed end) after running in at an input speed of 2000r/min under an average ambient temperature of 25° C without load for more than 2 hours.

Reduction Ratio	Input rotational speed	Model					Unit: cNm
		14	17	20	25	32	
50	500 r/min	6.3	17.8	23.6	37.2	58	
	1000 r/min	7.8	21.8	28.6	49.2	76	
	2000 r/min	10.1	27.8	37.6	62.2	98	
	3500 r/min	14.1	36.8	48.6	89.2	138

	kgfm	0.2	0.2	0.2	0.46	0.92

Table 4-5-9 B side mounting bolt tightening torque

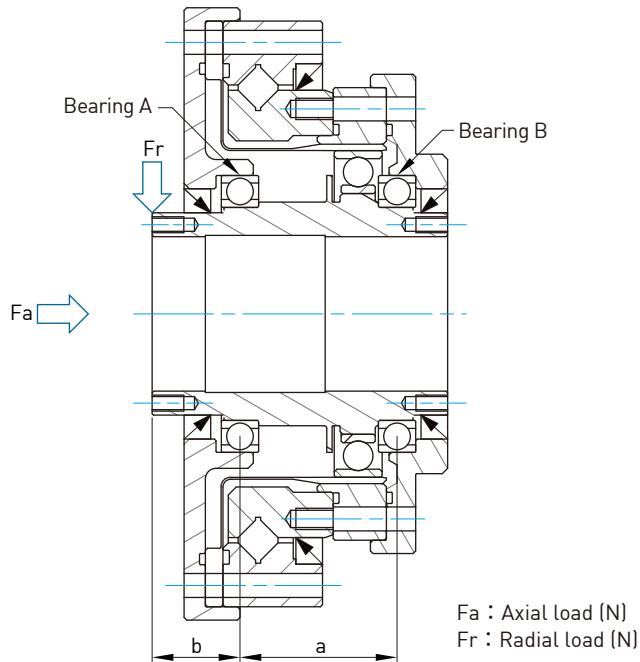

Item	Model	14	17	20	25	32
Number of bolts		8	16	16	16	16
Bolts size		M3	M3	M3	M4	M5
Installation of Bolts PCD	mm	44	54	62	77	100
Bolt tightening torque	Nm	2	2	2	4.5	9
	kgfm	0.2	0.2	0.2	0.46	0.92

Note : 1. Recommended tightening torques for the 12.9 DIN EN ISO 4762 fastening bolts DIN912 in accordance with VDI 2230 for $\mu K = \mu G = 0.125$

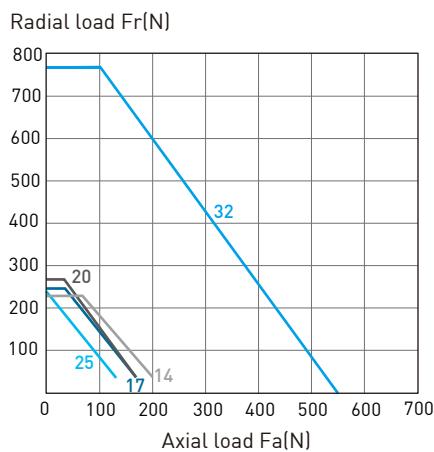

2. Bolt-in depth at least 2 x thread diameter

4-5-5 Permissible Input Load

The hollow shaft input section is supported by two deep groove bearings. To ensure proper performance of the reducer, please confirm the load applied to the input section. As shown below:

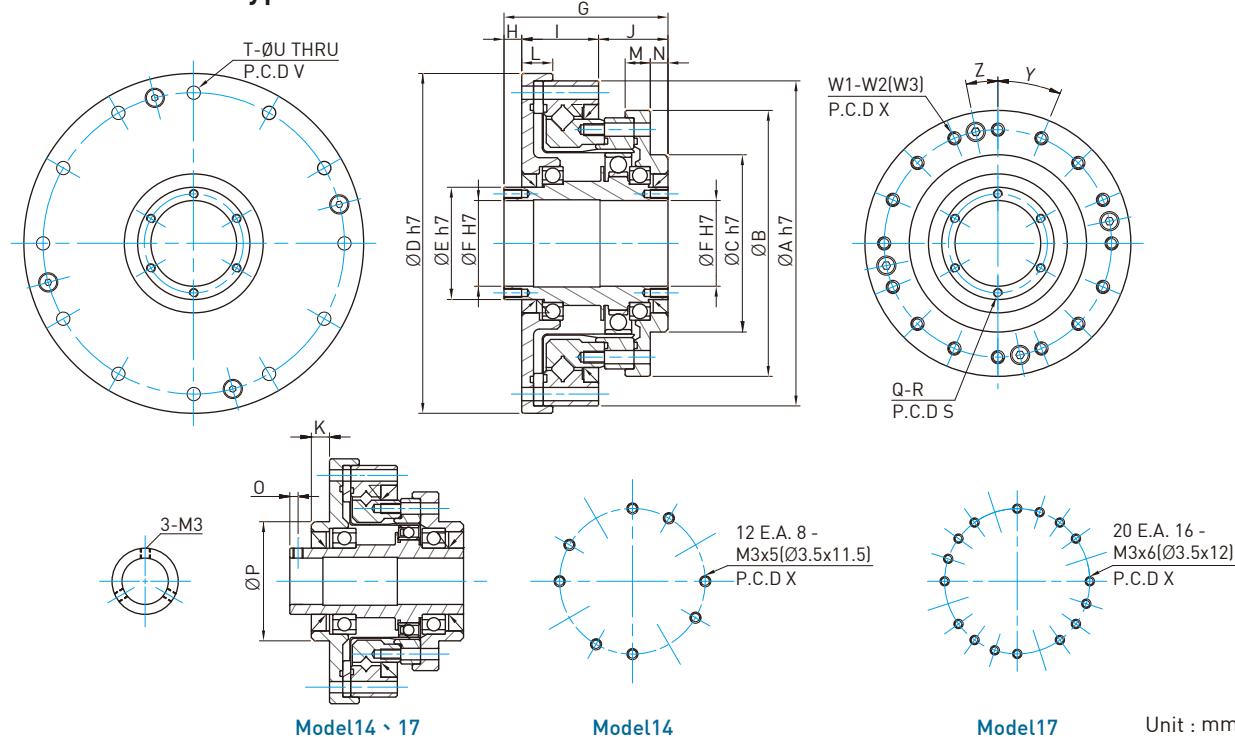

The figure below shows the average input speed of 2000rpm and the basic rated life $L_{10} = 7000$ hour.

Model \ Item	Bearing A		Bearing B		a (mm)	b (mm)	Maximum radial load F_r (N)

4-6-2 Efficiency

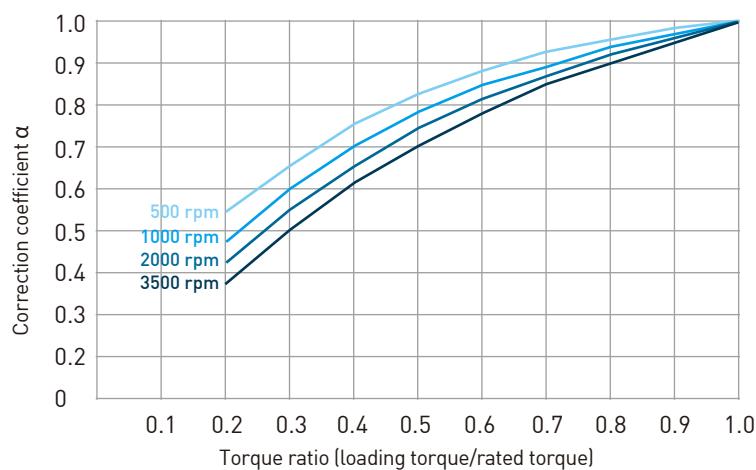

1. Rated torque E_R

DATORKER® efficiency would change by specification , ratio , operating conditions(speed/loading) and lubrication(lubricant type/quantity) .

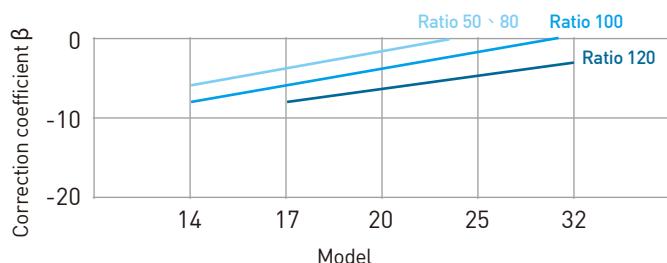

2. Correction coefficient α

Efficiency correction coefficient α
by loading torque

3. Correction coefficient β

Efficiency correction coefficient β
by specification

$$\text{Efficiency} = \alpha \times (E_R + \beta)$$

4-6-3 No-load operating torque

The torque necessary to drive the DATORKER® input (high-speed end) after running in at an input speed of 2000r/min under an average ambient temperature of 25° C without load for more than 2 hours.

Unit : cNm

Reduction Ratio	Input rotational speed	Model				
		14	17	20	25	32

Note : 1. Recommended tightening torques for the 12.9 DIN EN ISO 4762 fastening bolts DIN912 in accordance with VDI 2230 for $\mu K = \mu G = 0.125$

2. Bolt-in depth at least 2 x thread diameter

4-6-5 Permissible Input Load

The solid shaft input section is supported by two deep groove bearings. To ensure proper performance of the reducer, please confirm the load applied to the input section. As shown below:

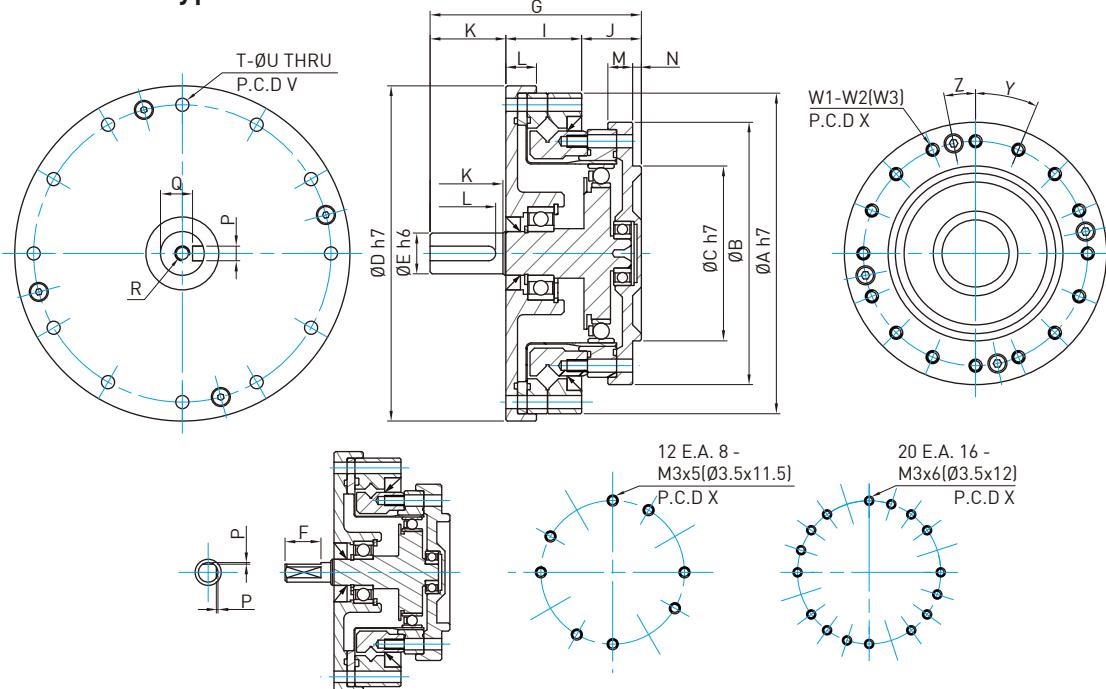

The figure below shows the average input speed of 2000rpm and the basic rated life $L_{10} = 7000$ hour.

Model \ Item	Bearing A		Bearing B		a (mm)	b (mm)	Maximum radial load F_r (N)
	Dynamic load C (kN)	Static load C_o (kN)	Dynamic load C (kN)	Static load C_o (kN)

		arc min	5.6	4.2	5.3	5.4	5.4
80 up	K ₁	×10 ⁴ Nm/rad	0.47	1	1.6	3.1	6.7
		kgfm/arc min	0.14	0.3	0.47	0.92	2.0
	K ₂	×10 ⁴ Nm/rad	0.61	1.4	2.5	5.0	11
		kgfm/arc min	0.18	0.4	0.75	1.5	3.2
	K ₃	×10 ⁴ Nm/rad	0.71	1.6	2.9	5.7	12
		kgfm/arc min	0.21	0.46	0.85	1.7	3.7
	θ ₁	×10 ⁻⁴ rad	4.1	3.9	4.4	4.4	4.4
		arc min	1.4	1.3	1.5	1.5	1.5
	θ ₂	×10 ⁻⁴ rad	12	9.7	11.3	11.1	11.6
		arc min	4.2	3.3	3.9	3.8	4.0

Note : The values are for reference only. The lower limit is 20% under the value in this table.

4-8-2 Installation bolt tightening torque

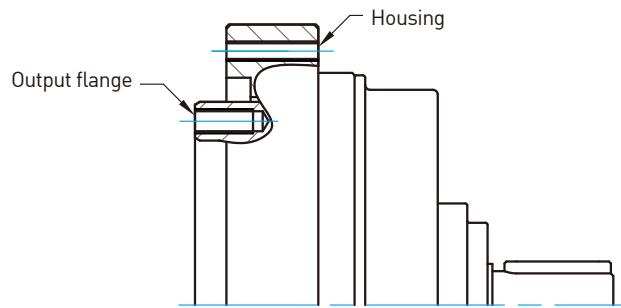

Table 4-8-8 Bolts tightening torque for Output flange

Item	Model	14	17	20	25	32
Number of bolts		12	12	12	12	12
Bolts size		M3	M4	M4	M5	M6
Installation of Bolts PCD	mm	43	52	62	76	96
Bolt tightening torque	Nm	2.3	5.1	5.1	10	17.4
	kgfm	0.23	0.52	0.52	1.0	1.8

Table 4-8-9 Bolt tightening torque for Housing

Item	Model	14	17	20	25	32
Number of bolts		8	12	12	12	12
Bolts size		M3	M3	M3	M4	M5
Installation of Bolts PCD	mm	68	80	89	105	135
Bolt tightening torque	Nm	2.3	2.3	2.3	5.1	10
	kgfm	0.23	0.23	0.23	0.52	1.0

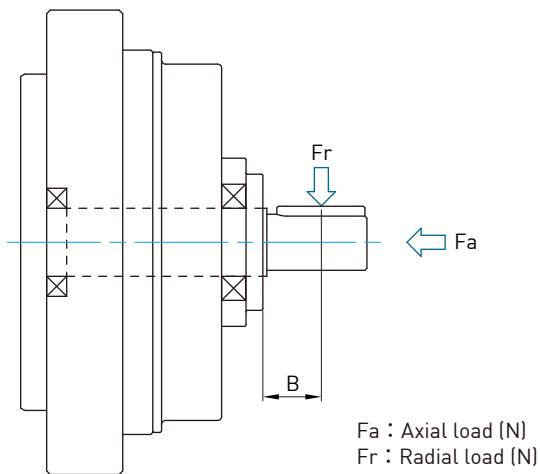

Note : 1. Recommended tightening torques for the 12.9 DIN EN ISO 4762 fastening bolts DIN912 in accordance with

VDI 2230 for $\mu K = \mu G = 0.125$

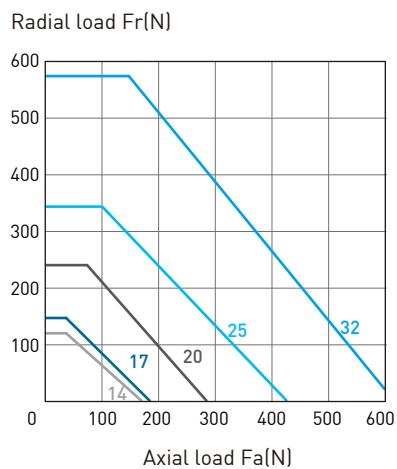

2. Bolt-in depth at least 2 x thread diameter

4-8-3 Permissible Input Load

To ensure proper performance of the reducer, please confirm the load applied to the input section.
As shown below:

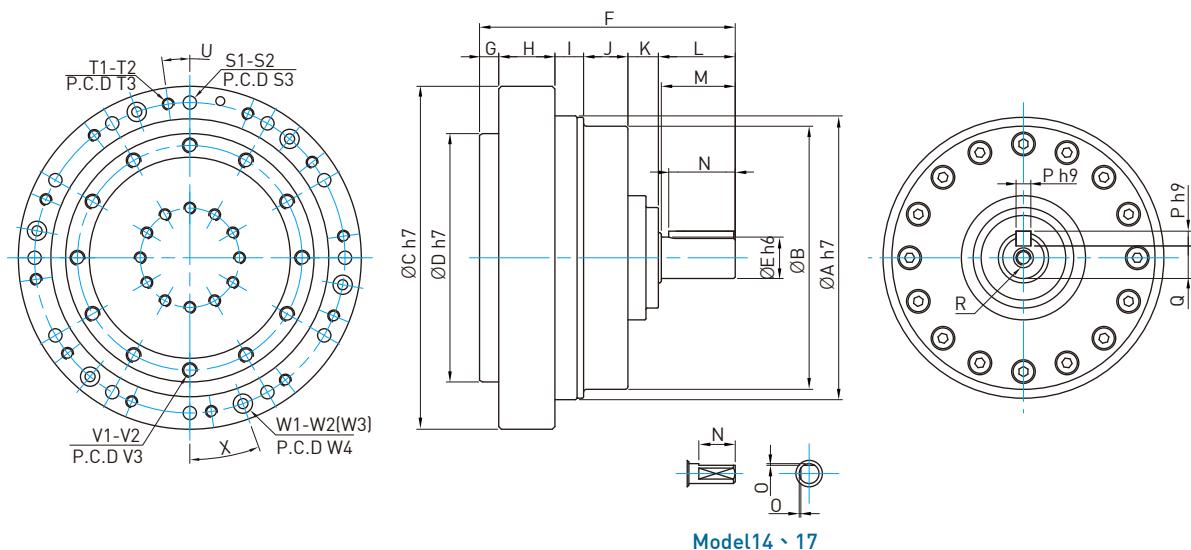

The figure below shows the average input speed of 2000rpm and the basic rated life $L_{10} = 7000\text{hour}$.

Item	Model	14	17	20	25	32
Offset (B)	mm	7	8	10	12.5	12.5
Maximum radial load (Fr)	N	118	145	232	342	567

5. Installation Notes

5-1 Precautions for installation of reducer body

- Check the flatness of the installation plane and ensure it is not inclined
- Check case mounting part and ensure it does not interfere with the body
- When locking the bolt, temporarily tighten to half the value of the specified torque in the diagonal order before reaching the specified torque. Do not tighten the bolts to the specified torque directly.
- The surface of the product is not treated with anti-rust. If anti-rust is required, please apply on the surface.

5-2 Precautions for installation of wave generator

- To avoid excessive force on the wave generator bearing during installation, please rotate the wave generator and insert it smoothly.
- If you choose a wave generator without the Oldham mechanism, kindly ensure to keep the concentricity and perpendicularity within the recommended range. (Refer to "Assembly accuracy" of each series)

5-3 Others

- Do not change the combination of product accessories to avoid affecting the overall performance and accuracy.
- Please do not use it for applications that may fall. Though there is no scar on the surface after falling, the change in internal stress may also reduce the fatigue strength. Please do not use it.
- It is strictly forbidden for dust and chips to fall into the product to avoid abnormal sound, wear and vibration during operation.
- Ensure to use the specified grease in the product. (Please refer to Chapter 6. "Lubricant" of this manual)
- Avoid overload operation
- Note that the input speed should be within the specified range
- Please use a thread locker (recommended to use Loctite242) in the thread hole and avoid leakage of the thread locker

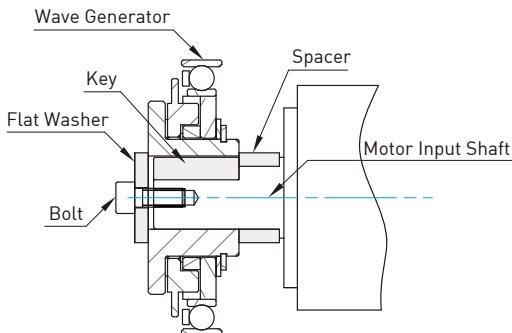

5-4 The following conditions may cause problems, please pay attention

- Overrun
- Insufficient lubricant
- Are the bearing/gear components damaged
- Poor connection with other interface components

5-5 If the following problems occur, please stop immediately and check the reducer

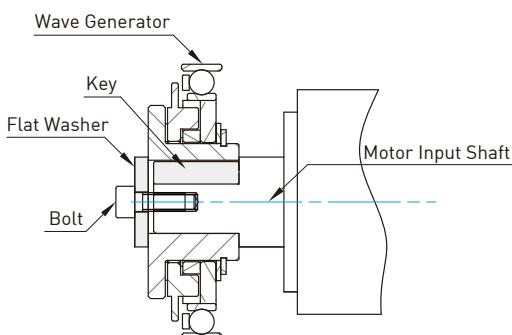

- The internal temperature rises over 80 degrees or the ambient temperature rises over 40 degrees
- Abnormal noise or vibration

5-6 Wave Generator and Input Shaft Connection Options

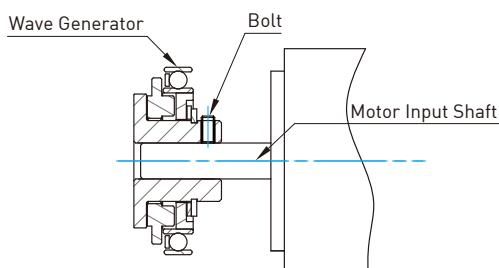

The motor input shaft has a shoulder that is not long enough, so it is necessary to install a spacer between the wave generator and the shaft, and fix it with washers and bolts.

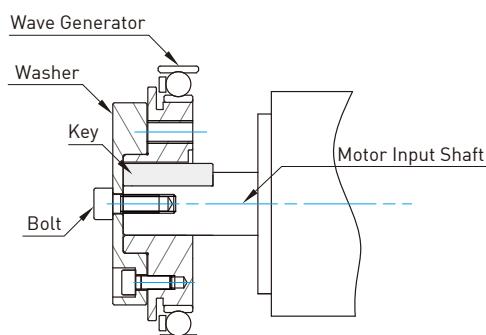

* The parallelism of both ends of the spacer should be less than 0.01mm.

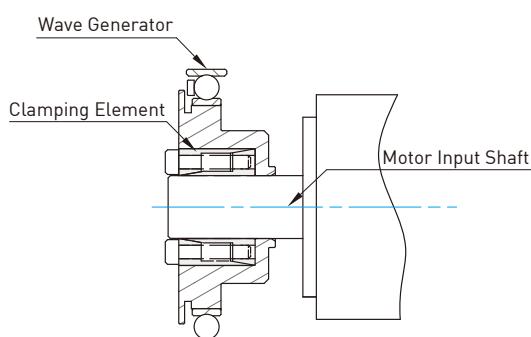

The motor input shaft has a shoulder, install the wave generator and fix it with washers and bolts.

The input shaft of the motor is a round shaft (without keyway). Install the wave generator and fix it with bolts.

Install the washer on the wave generator, then install it into the motor input shaft, and then fix it with bolts.

The wave generator is inserted into the motor input shaft, and then fixed with clamping element.

6. Lubricant

HIWIN G11 special lubricant oil for reducer

- Conditions and characteristics of use

1. Load resistance
2. Wear resistance
3. Excellent shear stability
4. Suitable for robots, automation equipment, semiconductor equipment, machine tools, etc.

- Basic Properties

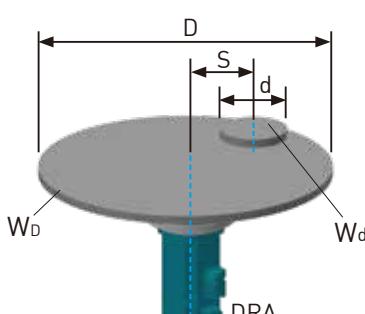

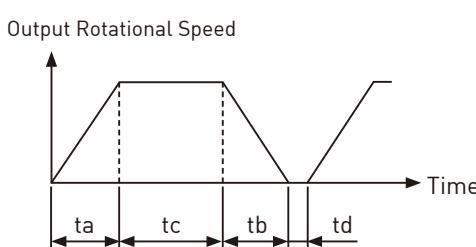

Colour	Yellow
Base oil	Mineral oil
Consistency Enhancer	Lithium soap
Service temp. (°C)	-20~130
Ambient working temperature (°C)	0~40
NLGI-grade (0.1mm)	265~295
Drop point (°C)	196

- Packaging specifications: 400g hard tube packed

- Others

1. HIWIN DATORKER® is prepacked with HIWIN G11 grease can be installed directly. Except for DSC-CO type, high speed and high torque conditions, it is recommended to apply additional grease to each part as per the Lubrication instructions in this technical manual.
2. Do not mix and use with different types of Lubricants.
3. For use in special conditions with high vibration, in clean room, vacuum, high temperature or low temperature, please contact us for more detailed evaluation.
